

MySQL

module 5 Joins

⇒ Joins

- Get info from different table
- Creating a common table by combine data from multiple tables.

Ex: (Tab 1)
Employee

id	name
101	
102	

(Tab 2)
Salary

id	Salary
102	
103	

}
Join

→ Type of Joins

1. Inner Join: To find common data

SELECT columns,

FROM TABLE(A)

INNER JOIN TABLE(B)

ON TABLE(A).col-name = TABLE(B).col-name

2. Left Join : To find data of A & common data.

```
SELECT column(s)
from TABLE(A)
LEFT JOIN TABLE(B)
ON table(A).col = table(B).col;
```

3. Right Join : To find data of B & common data.

```
SELECT column(s)
from TABLE(A)
LEFT JOIN TABLE(B)
ON table(A).col = table(B).col;
```

4. Full Join : Full data of both tables

LEFT JOIN
UNION
RIGHT JOIN

5. Left Exclusive : only A data

```
SELECT column(s)
from TABLE(A)
LEFT JOIN TABLE(B)
ON table(A).col = table(B).col;
WHERE table(B).col is NULL
```

6. Right Exclusive : only B data.

```
SELECT column(s)
FROM TABLE(A)
LEFT JOIN TABLE(B)
ON table(A).col = table(B).col;
WHERE table(A).col IS NULL
```

7. Self Join : Regular join but table is joined with itself.

```
SELECT columns
FROM table as A
JOIN table as B
ON A.col-name = B.col-name;
```

⇒ UNION

Combine results of multiple SELECT statements

Syntax:

```
SELECT column(s) from table A
UNION
SELECT column(s) from table B;
```

Conditions:

- Each SELECT should have same columns
- columns must have similar dtypes.
- columns in every SELECT should be in same order
