

Module 4 practice

Scenario: Count the number of customer records present in the database

Scenario: Find the average price of our products?

Find the average price of our products only upto 2 decimal places?

Identify the regions where the number of customers is high?

Scenario: Get the count of different Status

COALESCE is a clause in SQL used for handling the Null values.

 **Scenario:** Write a SQL query to find the number of payments received for each payment method on each date in order so as to analyze the trend over span of days

 **Scenario:** Identify the customers who spend more than 5000 on a single order and if single customer has multiple orders greater than 5000 show the order with the maximum amount.

Steps:

- First get the customer_id
- Group the data on the basis of customer id
- Get the maximum from the "total_amount" for each customer_id

Group orders by order date and calculate the total order amount for each date

Q2. Find customers who have placed more than one order

Q3. Identify products that have been ordered multiple times in the exact same quantity across different orders and determine the frequency of these occurrences
