

Practice

Sort customers by their first names in **ascending** order:

□ Sort products by their prices in **descending** order:

: Sort orders by their order dates in **ascending** order

: But it returns the entire list of all orders. Present me just the details of the last 10 Orders

Show me all the product categories we have

Why are categories getting repeated? Remove those duplicates

Is it possible to see the customer's first name list appearing with column name as Customer and not first name?

□ **Scenario:** Show me all the products that are marked under the 'Electronics' category

Scenario: Show me all the product categories we have except 'Clothing'

- List full names of customers who are from California state(represented as 'CA' in the database)
- I want to contact a customer named Jane. Give me his phone number
- I want to see the product names along with their price whose price is more than Rs.1000. Let the products be listed in the ascending order of their price

□ **Scenario:** Present me the product names priced between Rs. 500 and Rs.1000

- Give me the list of accessories names along with their price whose price is more than Rs.1000
- Present me a list of product names along with their category which belong to either the Clothing or Footwear category
- Present me a list of all products along with their category not belonging to the "Electronics" category

Scenario: Retrieve only the customer's email addresses that ends with 'gmail.com.'

Scenario: Retrieve the list of products whose name begins with letter 'L'

Scenario: Retrieve the list of customer's names who's first name contains exactly 3 letters

Combine the first & last name of customers to create a full name and write it all in capital letters

What is the length of the names of customers?

) Extract all the cities which has 2 words

) Extract the customers who belong to a specific domain name (for e.g. @example.com)

Extract "Class" from " Hello Class"
